AI-POWERED ADS. CONTENT THAT CONVERTS.
SYSTEMS THAT SCALE.

THE LEAD GEN GUIDE · KAREMOPS.AI

Pull 500 leads with one Claude Code prompt.

You commented "LEADS" — here's the exact setup. No lead-list subscriptions. No VAs scraping Google Maps for \$400/mo. Just Claude Code + Apify + one prompt that runs while you make coffee.

Inside this guide

- Step 1 — Grab your free Apify API key
- Step 2 — Connect Apify to Claude Code (10 seconds)
- Step 3 — The prompt that pulls 500 leads, ready to copy
- What to do with the leads once they hit your CSV

Karem AlMoayyad

@karemps.ai · Karemps.ai

Claude Code + Apify = your **scraping team.**

Apify is a marketplace of pre-built scrapers ("Actors"). One of them — the Google Maps Scraper — pulls every business in a city with their name, phone, email, website, ratings, and hours.

Claude Code is the terminal-based agent that runs on your laptop. Connect the two and you can tell Claude in plain English what leads you want — it calls the right Apify Actor, runs it, and dumps a CSV.

Heads up: Apify's free tier gives you \$5/mo in compute. That's roughly 500–1,500 Google Maps leads per month free. After that it's pay-as-you-go (about \$0.50 per 1,000 results). You don't need a paid plan to follow this guide.

What you'll be able to do

- Pull every plumber in Austin with email + phone in under 5 minutes
- Filter by rating, review count, hours, category — any field Google Maps shows
- Export straight to CSV → drop into GoHighLevel, Airtable, or your email tool
- Re-run on a different city/niche by changing two words in the prompt

What you need

- Claude Code installed (free — claude.com/claude-code)
- An Apify account (free — apify.com)
- 10 minutes

Grab your **Apify** key.

This is the credential Claude Code uses to talk to Apify. Treat it like a password.

Do this

- Go to **apify.com** and sign up (Google login is fastest)
- Click your profile icon top-right → **Settings**
- Click **Integrations** in the left sidebar
- You'll see "Personal API tokens" — copy the default one
- Paste it somewhere safe for 30 seconds (you'll need it next page)

Don't share this token publicly. Anyone with it can run scrapers on your account and burn your free credits. If you ever paste it in a screenshot or video, regenerate it in the same Integrations page.

What the token looks like

```
apify_api_aB3cD4eF5gH6iJ7kL8mN9oP0qR1sT2uV3wX4yZ
```

It always starts with `apify_api_` followed by ~40 random characters.

Connect Claude Code to **Apify**.

This wires up the MCP server — the bridge that lets Claude Code call Apify Actors directly from your terminal.

Do this

- Open your terminal (Mac: Cmd+Space → "Terminal")
- Run the command below — paste your Apify token where it says **YOUR_TOKEN**
- Then start Claude Code by typing **c**laude

The install command

```
claude mcp add apify \  
  --env APIFY_TOKEN=YOUR_TOKEN_HERE \  
  -- npx -y @apify/actors-mcp-server
```

That one line installs the Apify MCP server, stores your token, and registers it with Claude Code. You only do this once per machine.

Verify it worked

Inside Claude Code, type:

```
/mcp
```

You should see **apify** in the list with a green "connected" status. If it's red, your token is wrong or copied with extra spaces — regenerate it and run the install command again.

Already have Node installed? Good. If not, install it from nodejs.org first (LTS version). The **npx** command in the install line needs it.

Pull 500 leads.

Paste the prompt below into Claude Code. Change the bracketed parts. Hit enter. Walk away.

The prompt

I want you to use the Apify MCP to pull a list of leads.

Actor: compass/crawler-google-places

Search: [niche] in [city, state]

Example: "plumbers in Austin, Texas"

For each result, return:

- Business name
- Phone number
- Email (if available)
- Website
- Full address
- Google rating + review count
- Category

Filters:

- Only businesses with a website
- Only 4.0+ star rating
- Skip permanently closed
- Limit: 500 results

When done:

- Save the results as a CSV at ./leads-[niche]-[city].csv
- Print a summary: how many leads, average rating, how many had emails
- Show me the first 5 rows so I can verify

What to change: Only the two bracketed lines under "Search". Everything else is tuned. Want plumbers in Miami? Change "Austin, Texas" → "Miami, Florida". Want dentists in Phoenix? Change "plumbers" → "dentists" and the city.

What to do with the CSV

- **Cold email:** Drop into Instantly, Smartlead, or Apollo
- **Cold call:** Import to GoHighLevel as a contact list, run a power dialer
- **DM outreach:** Match the website domain to a founder name on LinkedIn

→ **Enrich first:** Run the emails through a verifier (NeverBounce, MillionVerifier) before sending
