

KAREMOPS.AI · FIELD GUIDE

The SID process.

How to turn any text script into a fully designed Instagram carousel inside Claude Code. No Canva. No designer. No AI slop.

INSIDE

The 3-step framework — Show, Idea, Design Deliver — that kills generic AI carousels. Connect Kie.AI to Claude Code, anchor one slide, generate the rest. End-to-end in 20 minutes.

KAREM ALMOAYYAD

@KAREMOPS.AI

Why most AI carousels look like slop.

People paste a script, type "make me 6 slides," hit go. Six slides come back that look like six different brands. The fix isn't a better prompt — it's a different process.

SID = Show, Idea, Design Deliver. Three steps, run end-to-end inside Claude Code. Each step builds on the last. References inform the brief. The brief locks one anchor slide. Every other slide matches that anchor. Same style across the whole carousel, every time, unique to you.

Steps 3

Anchor 1 slide

Time ~20 min

The non-negotiable. Never batch-generate the carousel. Anchor first. Lock it. Match the rest. This single rule is the difference between a custom carousel and the boring AI slop everyone else is cranking out.

What you'll walk away with

- What S, I, and D actually mean — and why the order matters
- Connect Kie.AI to Claude Code in one command
- The exact prompt that builds your design brief
- How to lock one anchor slide and match the rest to it
- How to save the whole flow as a reusable Claude skill

What you need before we start

- Claude Code installed (Pro, Max, Team, or Enterprise plan)
- \$5 on Kie.AI for ~80 images (enough for 10+ carousels)
- 3–5 reference carousels and one script you've already written
- 20 minutes the first time. 15 every time after.

The references aren't optional. Without them you get generic AI output. With them, Claude knows

Connect Kie.AI to Claude Code.

Before SID can run, Claude needs the ability to render images. Kie.AI is the MCP that plugs Claude Code into GPT Image 2 — slides get made inside the same chat. No tool-switching, no re-prompting in a separate app.

Cost **\$0.06 / image**

Quality **sharper than Nano Banana**

Bonus **same key unlocks Seedance · Flux · Veo · Suno**

```
# 1. Sign up at kie.ai → top up $5 → grab API key
# 2. Add the MCP to Claude Code
claude mcp add kie-image
# 3. Drop your KIE_API_KEY when prompted, confirm
```

Flat \$0.06 per image. One subscription replaces a stack of design SaaS. \$5 is enough for ~80 images — call it 10+ carousels before you have to top up again.

Feed it what **good** looks like.

Drop screenshots of carousels whose visual style you want into the chat. Real screenshots from creators you respect. Not links. Not "make it like Apple." Actual images.

This is the most-skipped step. People paste the script and hit go, then wonder why the output looks generic. References are how Claude learns the visual ceiling for *this specific* carousel.

What to gather before you prompt

- 3–5 reference carousels (real screenshots, not links)
- The script you want to repurpose into slides
- Bonus: logos, product shots, screenshots that need to live inside the carousel — Claude will use them directly

The brief is the **contract**.

Once Claude has your references and your script, ask it to build a full design brief *before* it touches a single slide. The brief is what makes the carousel feel cohesive instead of like 6 random slides stitched together.

Once Claude commits to the brief, every slide gets generated against the same spec. Skip the brief and every slide negotiates its own style. That's the slop you've been seeing.

What the brief locks

- Sharp idea + audience promise
- Color palette with hex codes
- Font pairing (heading + body)
- Slide-by-slide headline + support copy
- Graphic type per slide — text-only, screenshot, comparison, data viz
- The anchor slide spec (the one we lock first)

The exact prompt

Review the script and the reference carousels I just shared.
Build a full design brief — don't generate any images yet.

Include: idea, audience promise, color palette (hex codes),
font pairing, slide-by-slide headline + support copy,
graphic type per slide, and the spec for the anchor slide.

Once I sign off on the brief, we lock the anchor.

Read the brief before you generate. If the colors are off, fonts are wrong, or the copy is mid — fix it here. Every slide that gets generated after this inherits these decisions. Catching it now costs you 30 seconds. Catching it after slide 6 costs you the whole carousel.

Anchor first. Match the rest.

Generate one slide. Lock it. Match every other slide to it. That single rule is the difference between a custom carousel and the boring AI slop everyone else is cranking out.

01 · Generate the anchor

Generate just slide 1 — the anchor. Use the brief.
4:5 ratio, 2K resolution. Pull from the references for composition.

This is where we lock the visual style for the whole carousel,
so make it count. We'll match every other slide to this one.

Review the anchor. Tweak until it's right. Don't move on until you'd be proud to post it as a single image.

02 · Match the rest

Anchor's locked. Generate slides 2 through N matching that
exact spec — same colors, same fonts, same composition language,
same energy. Carry the brand into every slide.

Lock the whole flow as a Claude skill

Once the carousel hits, ask Claude Code to save the workflow as a skill. Every future script becomes a carousel in 15 minutes — drop the script, drop the references, run the skill, ship.

Save this workflow as a Claude skill called sid-carousel.
Include: reference upload step, brief generation prompt,
anchor slide spec, batch generation rules.

Now repurpose **every** script.

Connect Kie.AI to Claude Code once. Save the workflow as a skill. Then every script you've already written becomes a carousel in 15 to 20 minutes.

The new workflow

- Drop the script into Claude Code
- Drop 3–5 reference carousels
- Run the skill — Claude builds the brief
- Sign off on the brief, lock the anchor
- Generate the rest. Ship.

Time saved. What used to take a designer 2–3 days, or you 4–6 hours bouncing between Canva and ChatGPT, now runs end-to-end inside Claude Code in under 20 minutes. The bottleneck stops being the work and starts being how often you ship.

§ PAYOFF

That's the **whole** process.

Same one I'm running for my own carousels right now. The output stops looking like AI output. The brand stays consistent. The bottleneck moves from "can I make this?" to "what should I post next?"

If this hit, send it to one other person who's been stuck in Canva. They'll thank you.
