

KAREMOPS.AI · FIELD GUIDE

Plug Claude directly into your Shopify store.

Shopify shipped its AI Toolkit. Two commands and your agent can read docs, validate code, and run real store operations. Here's the no-fluff breakdown.

INSIDE

Wire Claude Code (or Cursor, Gemini, VS Code, Codex) into your Shopify admin. Update products, query the GraphQL API, generate Liquid + Hydrogen — all from a prompt.

What this **actually** is.

Shopify just dropped an official AI Toolkit. Two commands. A restart. Your agent now talks directly to your store.

You stop bouncing between Shopify Admin, docs, and your editor. You describe what you want in plain English and the agent does it — using Shopify's own conventions, validated against the live schema.

Heads up — the toolkit can execute real store changes through `shopify-admin-execution`. There is **no undo**. Always test on a development store before pointing it at production.

What you can do once it's connected

- Update products, inventory, and configuration from a chat
- Generate Liquid, Hydrogen, and Polaris extension code — validated against the live schema
- Query the Admin + Storefront GraphQL APIs without leaving the agent
- Build full Shopify apps (functions, payments, POS, customer accounts) following Shopify's own conventions

What you need before we start

- A Shopify store you have access to (use a **development store** for your first run)
- Node.js 18+ installed locally
- One of: **Claude Code, Cursor, Gemini CLI, VS Code, or OpenAI Codex**
- 5 minutes

Plugin install path supports the first four. Codex is skills + MCP only.

STEP 01

Pick your **install path**.

Three options. Unless you have a reason, use Plugins.

1. Plugins — recommended

Two commands and a restart. Auto-updates whenever Shopify ships new capabilities.

2. Agent Skills (manual)

Cherry-pick from 16 skill files. No auto-updates. Use this if you want fine-grained control.

3. Dev MCP Server

For teams already running MCP infrastructure. Doesn't include the full skill set.

STEP 02

Install in **your tool**.

Copy-paste the commands for your stack. Restart after install.

Claude Code

```
/plugin marketplace add Shopify/shopify-ai-toolkit  
/plugin install shopify-plugin@shopify-ai-toolkit
```

Cursor

Open the Cursor Marketplace → search "Shopify" → click Install.

Gemini CLI

```
gemini extensions install https://github.com/Shopify/shopify-ai-toolkit
```

VS Code

1. Enable Agent plugins preview in settings
2. Open the Command Palette (Cmd+Shift+P)
3. Run: Chat: Install Plugin From Source
4. Paste: <https://github.com/Shopify/shopify-ai-toolkit>

OpenAI Codex (skills + MCP only)

Run `/plugins` in the Codex CLI → search Shopify → Add to Codex.

Manual skills (any tool)

```
npm install @shopify/shopify-ai-toolkit
```

After install: restart your tool. In a new chat, ask the agent *"List my Shopify products"* to confirm the connection works.

STEP 03

Your first prompts.

Start read-only. Make sure it actually works before you let it touch anything.

01 • Test the connection

Using the Shopify AI Toolkit, list my stores and the first 5 products in each. Show ID, title, status, and inventory.

02 • Catalog audit

Audit my Shopify catalog.
Find products with no description, missing images, \$0 price, or zero inventory but status active.
Give me a fix list grouped by issue.

03 · Bulk update (paused, for review)

Draft a bulk update for my Shopify store:
rewrite product descriptions for the 10 lowest-converting products
in a clearer, more benefit-focused tone.
Show me the diff first. Do not execute until I confirm.

04 · Build a checkout extension

Using `shopify-polaris-checkout-extensions` and `shopify-functions`,
scaffold a checkout extension that adds a free gift when cart total is over \$100.
Validate against the live schema and walk me through deploying it to a dev store.

05 · Theme tweak in Liquid

Open my current theme. In `product.liquid`, add a "Low stock" badge
that shows when inventory is under 5 units.
Use Liquid only, no JS. Validate against `shopify-liquid` before saving.

§ RESOURCES

Official links

- Docs → shopify.dev/docs/apps/build/ai-toolkit
- GitHub → github.com/Shopify/shopify-ai-toolkit
- Agentic Commerce → shopify.dev/docs/agents

That's the **whole setup.**

You now have Claude Code (or your tool of choice) wired straight into Shopify. Read docs, write code, run real store operations — all from a chat window.

This replaces the part of the workflow where you context-switch between Admin, docs, and your editor 40 times a day. Now it's one prompt.

If this hit, send it to one other operator or dev who's still doing it the slow way. They'll thank you.

BUILT BY

Karem AlMoayyad

AI operator + educator. I help business owners ship AI systems that actually work — content, ads, automation, ecommerce ops. Built with Claude Code.
